

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

This scale model of the New Horizons spacecraft is designed for anyone interested, although it might be inappropriate for children younger than about ten years of age. Children should have adult supervision to assemble the model.

YOU'LL NEED THE FOLLOWING:

- ☐ A good pair of scissors.
 - ☐ An art knife, such as X-ACTO® #11, with a sharp new blade. Children must have adult supervision to use an art knife. You'll also need a cutting surface such as a linoleum pad, or thick chipboard, when using the art knife. **Use caution**
 - ☐ Wooden toothpicks for applying glue.
 - ☐ Glue. Use regular white glue (Elmer's Glue-All® or equivalent). You might also try a thick white glue, sold in art and fabric stores, called "TACKY GLUE" (Aleen's or equivalent).
 - ☐ Doublestick tape or a low-moisture glue, such as a glue stick.
 - ☐ A pencil or pen.
 - ☐ A metal ruler to use as a straight edge.
-
- ☐ Space. Set up a well lighted, comfortable work area, with room to set glued parts to dry.
 - ☐ Time. Don't hurry. Plan for about 2 hours if you concentrate solely on assembly.
 - ☐ Patience. Be sure you understand how parts are going together. Try fitting the parts together dry first before you apply glue.

TIPS

- Read all of these instructions. Examine the parts sheets and read the names of all the parts. Look for names on some of the tabs. Notice the difference between the top and bottom decks as well as the top and bottom of the center column.
- When referring to folding tabs up and forward mean towards the side with the spacecraft graphics. Down and back mean away from printed side
- When instructed to fold a part, consider scoring it first. To do this, line up a metal ruler or straight edge along the line to be folded, and very lightly scratch it with an art knife, only breaking the surface of the card stock. You have to be very careful not to cut through if you do this. While this is more time consuming, it will result in much neater folds, and may help the parts fit together properly.
- The liquid glues work best when applied very thin and given a half minute to soak in and dry a bit.

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

ASSEMBLY

- ☐ Cut out spacecraft TOP DECK and BOTTOM DECK.
- ☐ Cut out and remove material from deck center holes.
- ☐ Form folds along edges where RTG mount sections meet gold deck sections.
- ☐ Fold center hole tabs upward.
- ☐ Fold back white portions of BOTTOM DECK center hole tabs.

- ☐ Cut out SPACECRAFT SIDEWALLS.
- ☐ Fold back all the tabs along wall edges. Notice names of wall section tabs.
- ☐ Form folds between walls sections.

SPACECRAFT BODY

- ☐ Cover top side of each 'long wall tab' on spacecraft walls with doublestick tape or glue stick.

- ☐ With wall section lying flat and facing up, align long edge of TOP DECK on fold of 'long edge tab' marked 'Top Deck'.
- ☐ Attach and rub to assure adhesion.
- ☐ Repeat for BOTTOM DECK.

- ☐ Spread thin film of glue on tabs of one 'short sidewall' section.
- ☐ Secure tabs to undersides of top and bottom decks.
- ☐ Make sure assembly is not twisted.
- ☐ Repeat for other short sidewall.

- ☐ Spread thin film of glue on tabs of one 'diagonal sidewall' section.
- ☐ Secure tabs to undersides of top and bottom decks.
- ☐ Make sure assembly is not twisted.
- ☐ Repeat for other diagonal sidewall.

- ☐ Spread thin film of glue on tabs of one 'RTG mount' sidewall section.
- ☐ Secure tabs to undersides of top and bottom decks.
- ☐ Repeat for other RTG mount sidewall.

- ☐ Fold RTG mount end tabs one over the other. Place a dab of glue between each and hold flat until glue sets.

Spacecraft sidewall attachment

CENTER COLUMN

- ☐ Cut out CENTER COLUMN. Do not fold tabs.
- ☐ Curl CENTER COLUMN into cylinder with long tab behind other end.
- ☐ Apply glue and align so dashed line near long tab is just covered by other edge.

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

- ❑ Insert center column through TOP DECK and BOTTOM DECK center holes so CENTER COLUMN sticks out evenly. Make sure all tabs in both deck center holes remain outside of holes.
- ❑ Position CENTER COLUMN on so white portions of BOTTOM DECK tabs fold over bottom edge of CENTER COLUMN.
- ❑ Apply glue to back of BOTTOM DECK center hole tabs and secure grey portion to outside of CENTER COLUMN and white portions to inside.
- ❑ Apply glue to backs of TOP DECK center hole tabs and secure to CENTER COLUMN, so tab ends align with top edge of graphics on CENTER COLUMN.
- ❑ Cut out PROPELLANT TANK.
- ❑ Fold tabs forward.
- ❑ Insert PROPELLANT TANK into bottom of CENTER COLUMN with graphics and tabs facing out.
- ❑ Position PROPELLANT TANK so ends of tabs align with bottom edge of CENTER COLUMN.
- ❑ Orient PROPELLANT TANK so triangular pattern points straight away from RTG mount.
- ❑ Apply glue to back of PROPELLANT TANK tabs and affix to inside walls of center section.

RTG

- ❑ Cut out RTG THERMAL SHIELD.
- ❑ Fold in half and glue.
- ❑ Trim away any edges sticking beyond either side.
- ❑ Cut out RADIOISOTOPE THERMAL GENERATOR (RTG) body and RTG END CAP.

OPTION: Here is a higher fidelity RTG body with cooling fins. Follow these steps and substitute it for the RTG from the model Document.

- ❑ Cut out RTG body
- ❑ Score folds along dotted lines on opposite sides of RTG body
- ❑ Fold part along dotted and scored lines as shown below

- ❑ Glue fins together
- ❑ After glue has set cut out tapered sections of fins as shown

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

- ❑ Curl RTG body long-wise so small tabs are on each end of resulting cylinder.
- ❑ Glue long tab behind other edge. Align so edge is just short of graphics.
- ❑ Fold over tabs of one end of RTG body.
- ❑ Place glue between tabs and secure together. Use flat end of pen or pencil inside RTG to press end tabs against.
- ❑ Make sure folded end stays circular.
- ❑ Glue folded end of RTG body to THERMAL SHIELD, centered on white circular mounting area. Use flat end of pencil or pen inside RTG to press RTG body firmly to THERMAL SHIELD. Let set.
- ❑ Fold over tabs of other end of RTG, placing glue between each.
- ❑ Place RTG END CAP over tabs and hold in place until set.
- ❑ Apply film of glue over rectangle on back of THERMAL SHIELD.
- ❑ Attach RTG and shield to end of RTG mount of spacecraft body.
- ❑ Align edges of THERMAL SHIELD square to decks and walls.

HIGH GAIN ANTENNA

- ❑ Cut out HGA TOP and HGA BOTTOM. Cut out pie shaped sections. Cut 'radial tabs' in center of HGA TOP.
- ❑ Place doublestick tape or glue stick on backside of HGA TOP around outside edge. If using tape place it so it extends beyond edges. Avoid overlapping layers of tape.
- ❑ Place doublestick tape or glue stick down both edges of pie shaped cut of HGA TOP and HGA BOTTOM. Do not cover center 'radial tabs' on HGA TOP.
- ❑ With HGA TOP lying face down, mount HGA BOTTOM on back of HGA TOP.
- ❑ Center HGA BOTTOM and rotated with respect to HGA TOP as shown in illustration.
- ❑ Rub to assure adhesion.
- ❑ Trim any edges or tape sticking beyond either side.
- ❑ Form HGA (top and bottom) into cone with HGA TOP on inside surface.
- ❑ Rub seams to assure adhesion

Attachment of HGA BOTTOM to HGA TOP

FEEDHORN

- ❑ Cut out HGA FEEDHORN and 'extra material for handling' as marked.
- ❑ Curve into a cone shape with black portion inside. This takes patience.
- ❑ Once well formed place glue on face of tab and affix.
- ❑ When glued, cut away 'extra material for handling' down to black line. Trim into black portion as needed to make cone even.
- ❑ Place beads of glue on tabs of 'radial tabs' in center of HGA TOP.

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

- ❑ Press HGA FEEDHORN cone halfway into 'radial tabs' and hold it aligned with HGA until glue is set.
- ❑ Fold in tabs on top of spacecraft CENTER COLUMN. Leave tabs partly folded over.
- ❑ Apply glue to outside portion of CENTER COLUMN tabs.
- ❑ With HGA aligned so seam on HGA TOP is pointing straight back, press back of HGA onto glued tabs of spacecraft CENTER COLUMN. Adjust so HGA is centered on CENTER COLUMN and level with spacecraft deck.

SECONDARY

- ❑ Cut out HGA SECONDARY DISH and curve into cone with color on the inside.
- ❑ Place glue on face of tab and affix to back side of other edge of cone. Align so line on tab is just covered.
- ❑ Cut out SECONDARY SUPPORTS with 'extra handling for material'
- ❑ Form folds where each support leg joins grey center section along inside edge of support legs.
- ❑ Fold each support leg in half lengthwise.
- ❑ Use doublestick tape or glue stick to affix supports legs halves together.
- ❑ Cut away 'extra material for handling'
- ❑ Fold forward tabs on ends of each support leg.
- ❑ Using the seam on the backside of the HGA SECONDARY DISH as a reference, lightly draw two more lines dividing secondary into thirds radially.
- ❑ With the HGA SECONDARY DISH and SECONDARY SUPPORTS face down, position support legs with the center section pointing away from secondary dish.
- ❑ Glue end tab of one leg of each support leg pair to back of HGA SECONDARY DISH, with tab fold aligned with 1/3 division marks.
- ❑ Glue end tab of other leg of each support leg pair to back of secondary, with fold abutted to fold of adjacent support leg tab.
- ❑ Glue center section of each HGA SECONDARY SUPPORT over alignment rectangles on face of HGA TOP. Adjust positions so HGA SECONDARY DISH is level and centered over HGA FEEDHORN.

Fold pattern for HGA SECONDARY SUPPORTS

HGA SECONDARY SUPPORT attachment to HGA SECONDARY DISH

New Horizons Paper Model Assembly Instructions

Ver 1/3/06

REX AND SUPPORTS

- ❑ Cut out REX SUPPORTS with 'extra material for handling'.
- ❑ Form folds thru short portions of center sections, folding legs forwards.
- ❑ Form folds down long portion of legs bending halves backwards.
- ❑ Cut away 'extra material for handling'
- ❑ Glue folded support legs together.
- ❑ Glue two parts of third leg together.
- ❑ Fold pointed end tabs forward.

Fold pattern for REX SUPPORTS

- ❑ Apply glue to pointed tabs of REX SUPPORTS and affix to gold rim of HGA SECONDARY DISH where HGA SECONDARY SUPPORTS join HGA SECONDARY DISH.
- ❑ Cut out REX disk and glue to top of REX SUPPORTS.

CONGRATULATIONS, YOUR NEW HORIZONS MODEL IS COMPLETE.

New Horizons

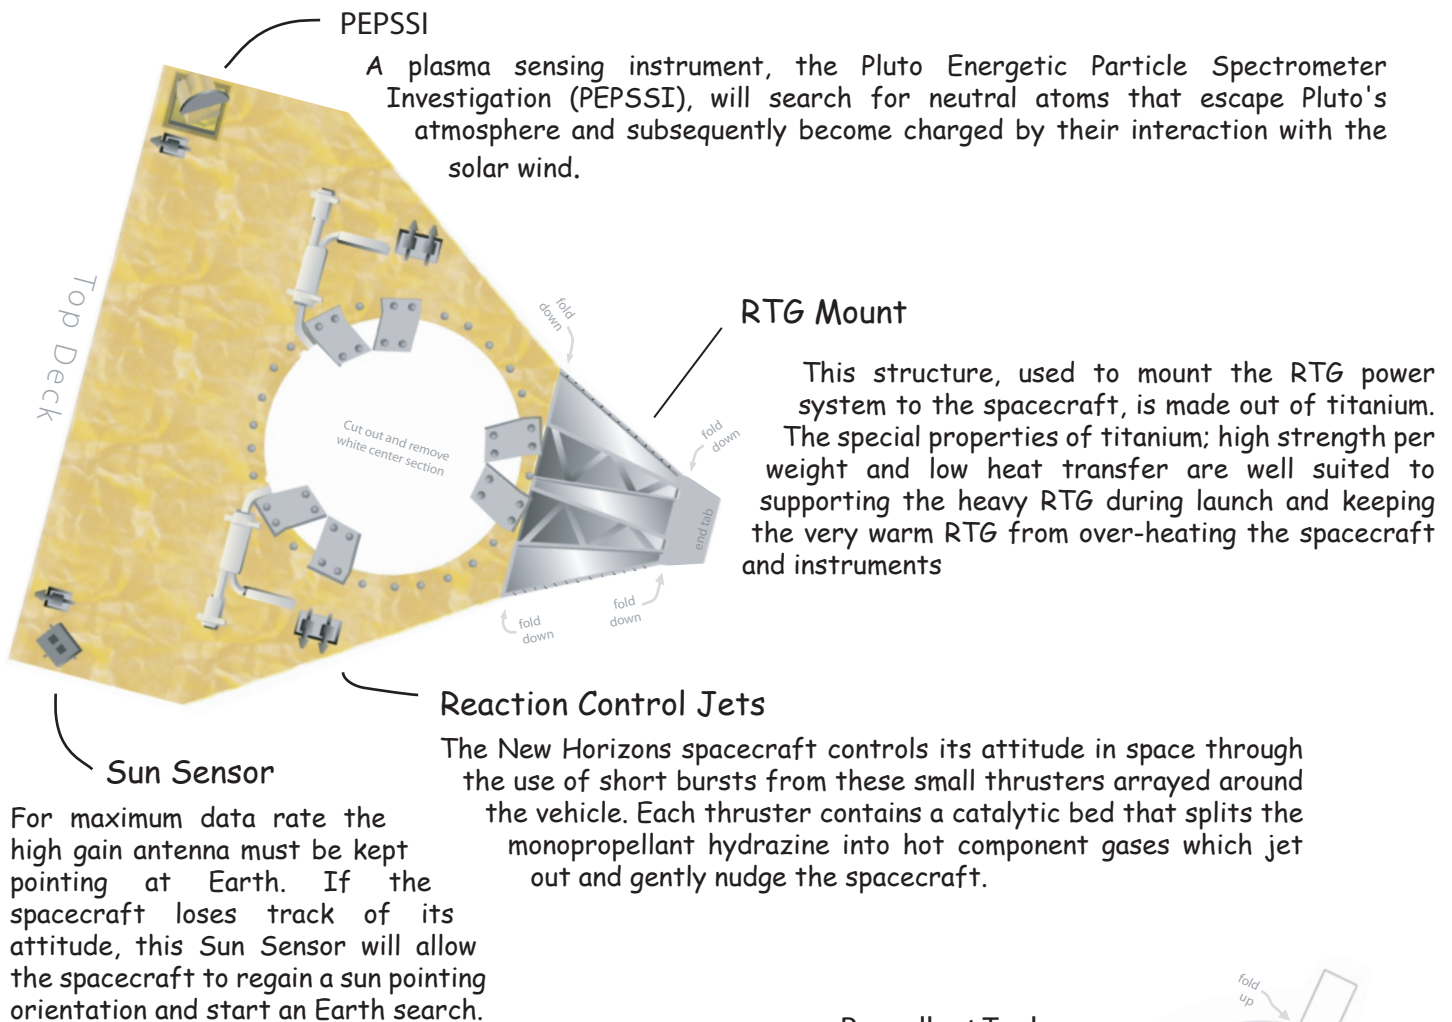

1/25 scale Paper Model

New Horizons is the first mission to the last planet. Build this model of New Horizons and learn about the spacecrafts systems. Then follow the progress of the mission as it swings past Jupiter out to Pluto-Charon and on to the Kuiper Belt.

Parts Set ver 6/26/06

The New Horizons spacecraft is about 6 ft (2 m) on a side and 2 ft (60 cm) tall, about the size and shape of a grand piano. It contains a propulsion system, a thermal control system, redundant computer, navigation and communications systems, as well as a suite of science instruments, all weighing a mere 1054 lbs (478 kg).

How to slim-down a spacecraft

The weight of the spacecraft structure is minimized by using honeycomb aluminum panels. The 1" thick panels are made of 1/8" cell aluminum honeycomb core with 0.005" thick aluminum foil sheets bonded to each face. This design cuts the weight of each panel to 1/9 that of an equally strong solid aluminum panel.

Propellant Tank

This tank, made of corrosion resistant Titanium and nestled in the center of the spacecraft where it can be kept warm, carries 170 lbs (78 kg) of liquid hydrazine to supply the reaction control jets for the entire 15+ year duration of the New Horizons mission.

Sitting just below the tank is a low gain antenna which provides low speed communications with Earth when the spacecraft's high gain antenna is pointing away.

The reaction control system is the sole means the New Horizons spacecraft has to alter its course after it separates from the launch vehicle 3rd stage. With the ability to change its speed by less than 300 m/s, New Horizons will only be able to alter its course by less than two degrees at Pluto. In-flight maneuvers must be carefully budgeted to save propellant for Kuiper Belt Object intercept maneuvers.

Some of the instrument's names are acronyms made up from longer names, but others are not. In particular the original, longer name of the acronym Alice no longer fits. Likewise when MVIC and LEISA were combined into a new instrument, there was no reasonable acronym, so who better to accompany Alice "to the moon" Charon, than Ralph?

SWAP

The Solar Wind At Pluto instrument will measure charged particles from the solar wind near Pluto to determine whether it has a magnetosphere and how fast its very thin atmosphere is escaping.

LoRRI

Shown with its cover open, the Long Range Reconnaissance Imager is the highest resolution instrument on-board. Its 8.2-inch (20.8 cm) telescope focuses visible light onto a panchromatic 1024 x 1024 pixel charge coupled device (CCD). At Pluto LoRRI will take images able to resolve football-field sized features.

Alice

Alice is an ultraviolet imaging spectrometer that will probe the atmospheric composition of Pluto. A "spectrometer" is an instrument that separates light into its constituent wavelengths, like a prism, only better. An "imaging spectrometer" both separates the different wavelengths of light and produces an image of the target at each wavelength.

Star Trackers

Dual cameras are used to compare the observed star fields against an on-board database of more than 18,000 star patterns.

Ralph

Using a single telescope with a 3 inch (6 cm) aperture, this compound instrument collects many wavelengths of light to obtain high resolution surface composition maps of the surfaces of Pluto and its moons. Internally one section, the Multispectral Visual Imaging Camera (MVIC) operates at visible wavelengths and another the Linear Etalon Imaging Spectral Array (LEISA) senses infrared (heat radiation) wavelengths.

As the New Horizons mission progresses, maintaining the internal temperature is a changing balance between heat production and heat loss. Early in the mission solar heating and excess heat from the RTG power system has to be radiated away. As the spacecraft recedes from the sun and RTG heat production drops, keeping every bit of available heat becomes critical.

Shunt Radiators

During periods of reduced electrical needs excess power is radiated to space as heat. Several of these shunt radiators, painted off-white and located around the outer spacecraft are used to essentially heat deep space.

Louvered Radiators

The louvers on these radiators rotate to expose more or less of the underlying surface to the cold of deep space. Using these radiators to control the heat flow the internal temperature is maintained near room temperature.

SDC

The Student Dust Counter, designed, built and operated by students at the University of Colorado, faces in the direction of spacecraft travel so is exposed to dust particle impacts. By studying the distribution of dust left over from the formation of the solar system, we will learn more about the planet formation process.

Center Column

The lower edge of the center column mates to the third stage of the New Horizons launch vehicle. It absorbs much of the forces during launch. After third stage burnout, four spring loaded attachment points are released pushing the spacecraft clear of the spent rocket.

Why is it crinkly looking and gold?

To keep heat from escaping to deep space the entire spacecraft is wrapped in Multi-Layer Insulating (MLI) blankets. One side of each mylar layer reflects heat inward and the other resists radiating it outward. The several layers MLI are loosely held ~1.5" (4 cm) apart and off of the spacecraft decks. Once in space the vacuum between the layers prevents heat from conducting between them so the system acts like a thermos bottle inside a thermos bottle.

In addition to thermal control the MLI helps protect the spacecraft from micrometeorites. Incoming particles are shattered and lose energy as they penetrate MLI layers. The large spacing between New Horizons MLI layers serves to disperse the shower of penetrating debris over larger areas at the lower MLI layers, spreading out the impact energies.

The New Horizons spacecraft and instrument suite were specifically designed to use as little power as possible, even so with everything running they require ~190 watts of electricity. At Pluto the sun is only 1/1000 as bright as it is at Earth making power production with solar cells impractical. Instead New Horizons uses a Radioisotope Thermoelectric Generator (RTG), sometimes called a 'Space Battery'.

Radioisotope Thermoelectric Generator

The Radioisotope Thermoelectric Generator (RTG) uses heat from the decay of Pu^{238} at its center to produce electrical power for the New Horizons spacecraft and its instrument payload. Thermoelectric junctions are less than 10% efficient, so to produce the 200 watts of electrical power for the spacecraft, the RTG requires more than 2000 watts of thermal energy. Vanes on the exterior surfaces of the RTG dissipate this heat away to deep space.

RTG end cap

RTG Thermal Shield

This Multi Layer Insulation covered shield prevents the waste heat radiated by the RTG from striking the New Horizons spacecraft. A small amount of heat conducts through the titanium RTG mount into the spacecraft structure and is used to keep the spacecraft electronics from getting too cold.

Electricity from heat?

In thermo-electric junctions, specially formulated materials inhibit atom-to-atom heat transfer relying on mobile electric charge carriers to convey thermal energy.

When one end of a junction is warmed and the other cooled, thermally excited electrons from the warm end vibrate about displacing other electrons towards the cooler end. As long as the heat is dissipated away from the cool end, the electrical charge imbalance is maintained and a few volts of electrical potential is produced.

A complementary junction can be made of materials that use positive charge carriers, instead of electrons, to convey heat and charge away from the warm end. Connected beside a junction of the other type a complete circuit can be formed, or multiple pairs can be linked to increase the output voltage.

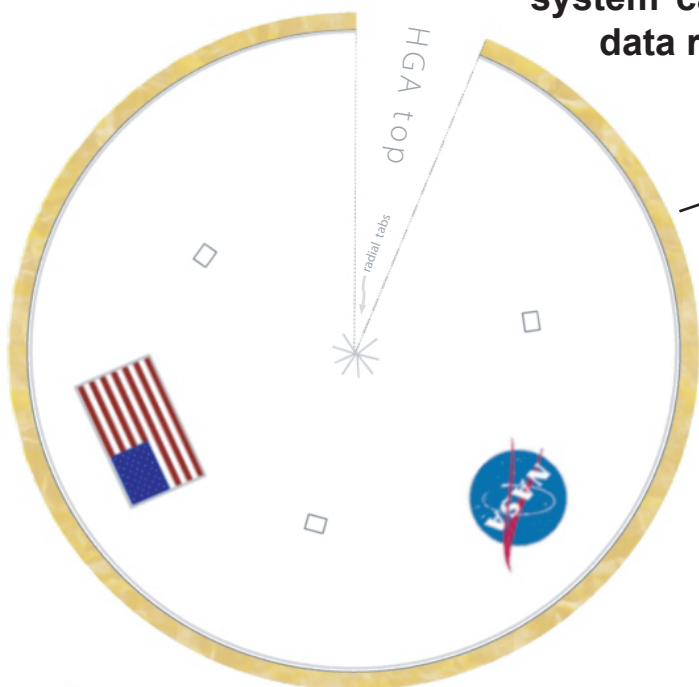

Radioactive Decay

Many elements occur in various different forms, called isotopes, which differ in the number of neutrons in their nuclei. The deficit or surplus of neutrons make the nuclei energetically unstable causing them to, randomly over time, drop or 'decay' to more stable states. In decaying to the more stable states the energy difference is released as free particles and heat which 'radiates' away.

The RTGs on New Horizon use an isotope of Plutonium Pu^{238} , which has 6 too few neutrons. As it decays to a stable state, Pu^{238} emits radiation mainly in the form of alpha particles, which consist of two protons and two neutrons bound together into a particle identical to a helium nucleus. At launch the RTG will produce about 250 watts of electrical power using the heat of Pu^{238} decay. With a Pu^{238} half-life (the time it takes for half of the radioisotope to decay) of 88 years, the RTG power will drop to about 200 watts when New horizons reaches Pluto.

When the New Horizons spacecraft is at Pluto its radio signals will take 4 hours 25 minutes to reach Earth. Along the way the 15 watts from the spacecrafts transmitter will spread out and drop to tens of nano watts collected by the 70m (230 ft) dishes of the Deep Space Network. If there is enough electrical power at Pluto, both halves of the spacecrafts redundant radio system can be used to boost the combined data rate to 1500 bits per second.

High Gain Antenna

The size of the High Gain Antenna (HGA) main dish affects the spacecrafts radio reception and transmission. A larger dish not only collects more incoming signal, it also forms the outgoing signal

HGA Secondary Dish

The secondary dish acts as a reflector between the main dish and the feedhorn. Outbound signals from the feedhorn are turned around at the secondary and spread out to cover the main dish to take advantage of its full size. Incoming signals, reflected and focused by the main dish, are redirected into the feedhorn and the receiving electronics.

HGA Feedhorn

The feedhorn directs the radio signals in and out of the spacecraft, between the transmitting and receiving electronics and the antenna dishes.

REX

The Radio Experiment (REX) sits out in front of the HGA dishes. As the spacecraft passes behind Pluto, with respect to Earth, REX will precisely measure how incoming radio signals are affected by the thin Pluto atmosphere.
